The children's workshop was organized by the Croatian Geological Survey, i.e. the Department of Hydrogeology and Engineering Geology in order to promote the EU Interreg project titled PROLINE-CE. The workshop was held on June 19th at Foginovo river beach in Karlovac. The kids had a chance to try out a number of fun experiments, and learn something about the preservation of drinking water. The workshop was free for everyone who wanted to join them, which resulted in a large number of interested children.

The project's objective is the sustainable protection of water resources and improved flood risk prevention and will provide new, international, applicable guidelines for all relevant stakeholders and decision-makers. This will stimulate interdisciplinary and international cooperation in the field of water management, forestry, agriculture, spatial planning and nature conservation.

The aim of such workshops, apart from presenting the project to raise awareness of water resource protection, is certainly the popularization of science in children with numerous interesting experiments. The workshop was led by the Proline-CE representatives from the Croatian Geological Survey and children educators.
