Decision Support System (DSS) for Planning of Natural (Small) Water Retention Measures

Supporting the planning process of N(S)WRM, DSS web application planning.waterretention.sggw.pl was created under the development of FramWat project. The goal of the application is to familiarize the user with the catalog of N(S)WRM and the planning process as well as to survey their preferences for their area of interest. Part of the DSS is the **N(S)WRM planner** which helps with facilitation of local stakeholders preferences for planning measures in the field of water retention. It is helpful for preparing data, necessary for developing a concept plan and estimating the investment risk.

General diagram of DSS

The Decision Support System (DSS) can be downloaded from here:
